

CSE 3521: Introduction to Artificial Intelligence

[Many slides are adapted from the [UC Berkeley. CS188 Intro to AI](#) at UC Berkeley and previous CSE 3521 course at OSU.]

THE OHIO STATE UNIVERSITY

Supervised learning

- Data type: $\{(x_1, y_1), \dots, (x_N, y_N)\}$

- Goal: Build a model so that given a future data instance x , it can tell the label y
 - Example: Nearest neighbors

- The “label” in $\{(x_1, y_1), \dots, (x_N, y_N)\}$ provides supervision of how to give each data instance a label
- The label can be “numerical” (regression) or “categorical” (classification)

The general representation of data instances

- Definition:

- A categorical value takes one category from a set of categories.
 - There is no intrinsic ordering of the categories
- A numerical value is a real number.
 - There is a clear ordering and space between values.

- Examples:

- Coin instance: **weight** = 2.5 (g), **size** = 16.5 (mm)
- Car instance: **brand** = Mazda, **year** = 2015, **color** = blue

The general representation of data instances

- Mathematical representations:

- **Numerical values:** vectors

weight
size

2.5
16.5

 or $\begin{bmatrix} 2.5 \\ 16.5 \end{bmatrix}$

- **Categorical values:** a one-hot vector for each feature variable (each has exactly one **1**)

Properties

- A vector element: index & value
- Every two one-hot vectors of different categories are of the same distance

Popular data instances in applications

- **Computer vision:** image & video
- **Natural language processing:** sentence & document
- **Speech:** utterance
- **Robotics:** LiDAR point cloud
- **Health care:** electronic health record (EHR)

Computer vision

Image (s)

Video (s) = sequence of images

RGB image (s): Three matrices

Gray images (s): One matrix

Natural language processing

Character → Word → **Sentence** → **Document** → Doc. collections → ...

Artificial intelligence (AI), sometimes called machine intelligence, is intelligence demonstrated by machines, unlike the natural intelligence displayed by humans and animals. Leading AI textbooks define the field as the study of "intelligent agents": any device that perceives its environment and takes actions that maximize its chance of successfully achieving its goals. Colloquially, the term "artificial intelligence" is often used to describe machines (or computers) that mimic "cognitive" functions that humans associate with the human mind, such as "learning" and "problem solving"

Machine learning (ML) is the study of computer algorithms that improve automatically through experience. It is seen as a subset of artificial intelligence. Machine learning algorithms build a mathematical model based on sample data, known as "training data", in order to make predictions or decisions without being explicitly programmed to do so. Machine learning algorithms are used in a wide variety of applications, such as email filtering and computer vision, where it is difficult or infeasible to develop conventional algorithms to perform the needed tasks.

31	1F	[UNIT SEPARATOR]	63	3F	?	95	5F	_	127	7F	[DEL]

Are these numbers “numerical values” or “categorical values” (indices)?

Is “a” (97) semantically closer to “b” (98) than “p” (112)?

If we change the order in the codebook, does it matter?

Natural language processing

Character → Word → Sentence → Document → Doc. collections → ...

One-hot representation:

- 256-dimensional {0, 1} vector
- Each column has exactly one **1**

Properties

- A vector element: index & value
- Every two one-hot vectors (columns) are of the same distance if they are not the same

Natural language processing

Character → Word → Sentence → Document → Doc. collections → ...

- A word can be represented as a sequence of character indices (a sequence of one-hot vectors)
- A word can be also represented just by a one-hot vector
- More: “happy”: 0001235, “pleased”: 0128736, “sad”: 0059875, (from a dictionary)
- What is the vector dimension?

Natural language processing

Character → Word → **Sentence** → **Document** → Doc. collections → ...

- A sequence of words OR a unique index of each sentence?
- If there are 10K unique words, and each sentence is of length 10, how many indices?

tokenization

Machine learning (ML) is the study of computer algorithms that improve automatically through experience. It is seen as a subset of artificial intelligence. ...

"<Start>" "machine" "learning" "("
"<UNK>" ")" "is" "the" "study" "of"
"computer" "algorithms" "that"
"improve" "automatically" "through
experience" "." "<End>" "<Start>"
"it" "is" "seen" "as" "a" "subset" "of"
"artificial" "intelligence" "." "<End>" ...

- Sequences of indices/one-hot vectors of words
- <UNK>: out-of-vocabulary (OOV) words

Speech

- Utterance: a spoken word, statement, or vocal sound

- Time-frequency representation:

Health care

- Electronic health/medical record (HER/EMR)

- ICD-9/ ICD-10 codes

Diagnosis	ICD-9	ICD-10
Cervical Sprain, initial encounter	847.0	S13.4xxA
Thoracic Sprain, initial encounter	847.1	S23.3xxA
Lumbar Sprain, initial encounter	847.2	S33.5xxA
Cervical Degenerative Disc Disease	722.4	M50
Thoracic Degenerative Disc Disease	722.51	M51
Lumbar Degenerative Disc Disease	722.52	M51.2

Properties

- Multi-hot
- One-hot
- All-zero

- Every time you see a doctor, some diagnoses are made (with codes)

In summary

- Data instances from many different applications can be represented by vectors or matrices!
- Linear algebra is a very efficient and effective way to perform computation (e.g., discovering patterns) on them!
- There are many other ways to represent data instances!

Data representations (aka features)

THE OHIO STATE UNIVERSITY

Machine learning (ML): detect patterns in data

From the perspective of first-order logic:

○ A coin with weight = 5.65 g and diameter = 23.6 mm \Rightarrow 10 cent

○ A coin with weight * 0.2 + diameter * 0.04 < 2 \Rightarrow 10 cent

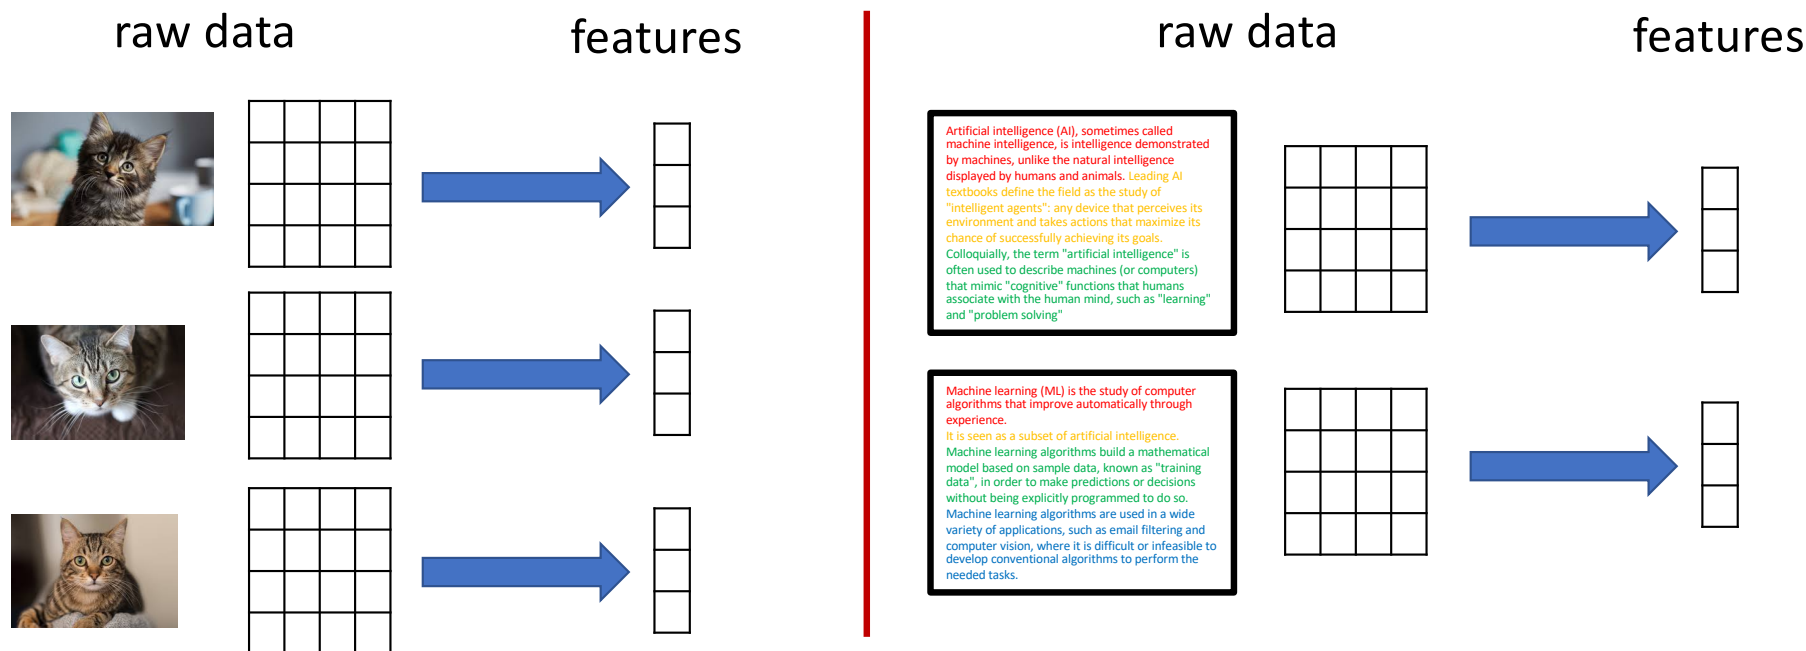

Patterns:

- to be detected by ML
- Built upon features

Feature variables:

- Values (facts) are to be extracted from the data
- What feature variables should we use/define?

Data vs. features

- Can we use raw data representation as features?
- If so, why bother further extracting features from the raw data?
 - *simplify the data, remove unrelated information, domain knowledge,*

Feature extraction

Feature extraction starts from an initial set of measured data and builds derived values (features) intended to be:

- Informative
- non-redundant
- facilitating the subsequent learning and generalization steps
- leading to better human interpretations

Feature extraction

- **Bag-of-words (BOW) representation**

- BOW for natural language processing and computer vision
- Feature normalization: L1 and L2 normalized

- **Dataset representation**

- Histogram and Parzen window
- Feature correlation
- Feature normalization: z-score, whitening

- **Dimensionality reduction**

- Principal component analysis (PCA)
